

## Activity 3: Introduction to iNaturalist

Grades: 9-12

Time: 45 minutes

Location: Classroom

### Big Ideas/Themes

- Biodiversity and Society
- Citizen Science and Open Science
- Science Practices and Skills

### Essential Questions

- How does iNaturalist work and what are the key features?
- How do we add observations to iNaturalist?
- How can observations from iNaturalist contribute to open science and citizen science?

### Objectives

- Students will **contribute** to the ongoing effort to discover and document biodiversity
- Students will **practice** how to filter, search, and organize observations in iNaturalist
- Students will **explore** the features of iNaturalist
- Students will **collaborate** productively in an online community

### Materials

- Computers with internet access
- Smartphones
- Leaves, branches, flowers, or insects from outside (optional)

### Directions

#### Preparation for Teachers

iNaturalist (often called iNat) has an excellent [Teacher's Guide](#) to help you and your students make the best observations and get the most out of interacting with the iNaturalist Community. Please take a moment to review the major points of this teacher's guide.

#### Preparation for Students

Students should be familiar with iNaturalist from their "Introduction to Biodiversity" lesson. In this activity, students will create accounts and explore the different features of iNaturalist, then practice making observations.

This activity assumes that students have access to mobile devices and/or a camera and computer with internet. If students have access to computers in the classroom, have students work in small groups or individually for this activity. If students do not have computers but are able to use smartphones and/or tablets, demonstrate the features of iNaturalist on the computer and have students use their mobile

devices to create accounts and practice making observations. **A projector will be needed for the iNaturalist demonstration.**

## iNaturalist account setup

Have students download the iNaturalist app at home before class to save time. Assign usernames to students so that you can identify them on iNat. Depending how you plan to use iNaturalist, you can create a shared class account that all students use, or create individual accounts for students that you can ID (teachername\_student# or teachername\_studentlastname or schoolname\_teacher\_student). Or, you might have all students create their own accounts that they feel empowered to use personally as well. Children under the age of [13 cannot have their own account](#), but can use a class account.

## Engage

See above for iNaturalist account setup. Prior to activity, have students download the iNaturalist app and create an account (or log into a class account). Consider which type of accounts would be best for you and your students. Go to [iNaturalist.org](#) and project on screen, or if students have computers, have students follow along with your demonstration.

*So what is iNaturalist?*

“**iNaturalist.org** is a place where you can **record** what you see in nature, **meet** other nature lovers, and **learn** about the natural world.”

The iNaturalist site is a global community of naturalists who share information about biodiversity. This effort is very powerful and demonstrates how citizens can help contribute a huge amount of meaningful scientific data that scientists may not have the resources to collect themselves.

## Explore

Do a tour around iNaturalist, showing students the features of the following tabs at the top of the page:

**Observations:** see the map of the world with tallies of

- Total number of observations
- Number of species identified
- Number of users

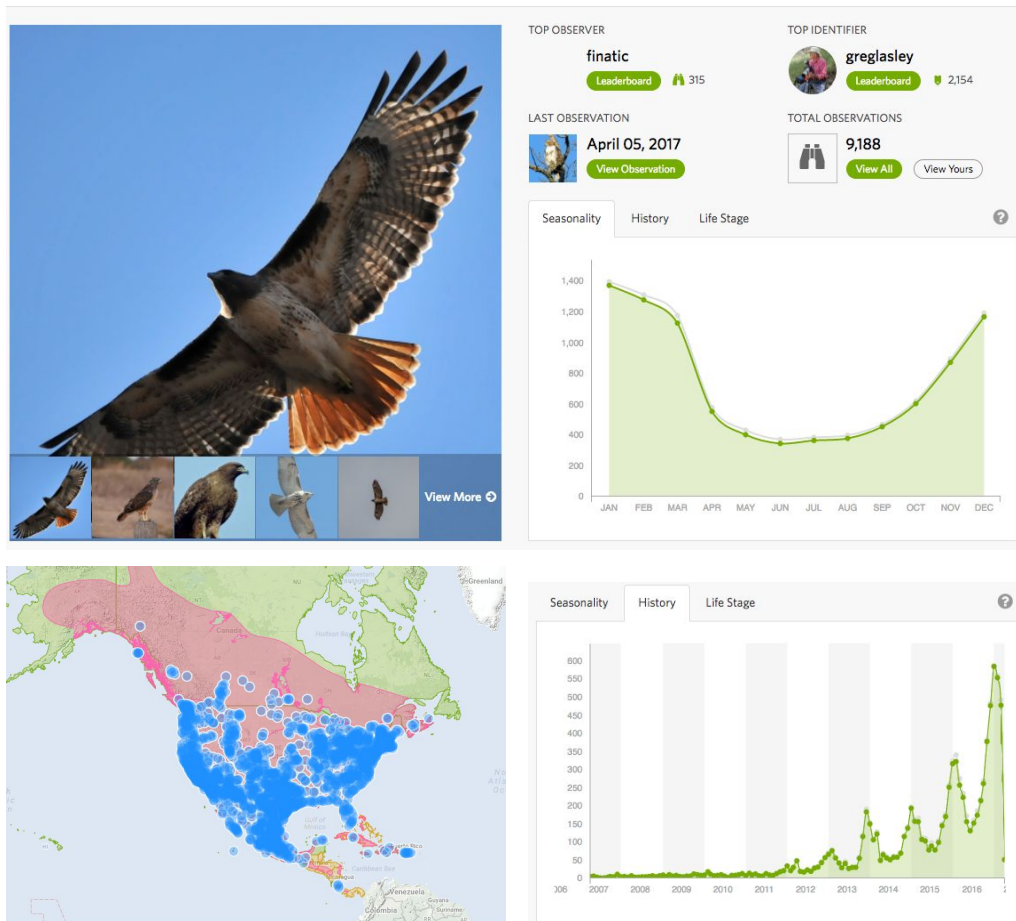

Image: Number of observations, species, identifiers, observers from Observations tab, collected 6/12/17

**Species:** search for a species in the species tab and highlight the graph and map features. You can toggle between information from the Encyclopedia of Life or Wikipedia. Pages also have links to other outside sources.

## Red-tailed Hawk (*Buteo jamaicensis*)

Filter By Place

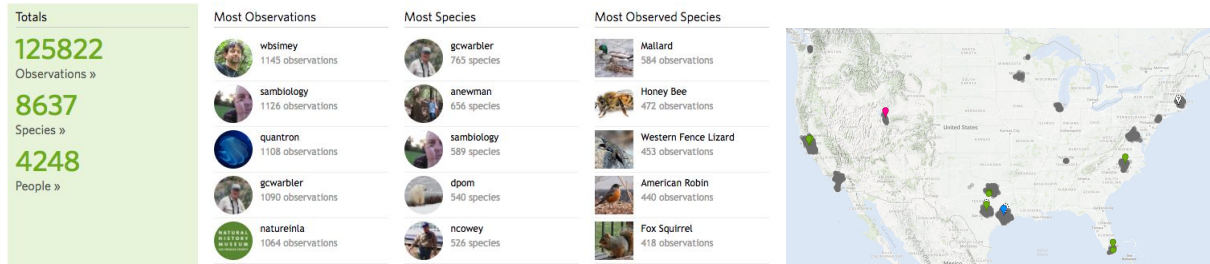

Example: Images, graphs of seasonality and observation history, observation map from iNaturalist species page for Red-tailed Hawk.

### Projects:

\*Note: for this activity, we will use the iNaturalist City Nature Challenge, a competition among U.S. cities to document as much biodiversity in 5 days, as an example to explore projects, places, and using other features.

- Projects are a feature that allow people to organize observations by location, taxon, time, etc. Projects range from the [Global Reptile Bioblitz](#) which collects any observations of reptiles around the world, to backyard projects for families to document what they see at home.
- In the “Projects” tab at the top, search for [City Nature Challenge 2017](#) and scroll through results until you find the project. In 2017, the competition was extended to 16 U.S. cities. It will bring you to the project page with the total observations, species, and people from all City Nature Challenge projects. Look at the map to see which metropolitan area closest to you participated.
- Expand the “about” section on the right side and click on the city closest to you, which will bring you to that city project.

Images: Results from the 2017 City Nature Challenge shows total number of observations, species, and people; and top 5 observers, identifiers, and most observed species. The map shows the spread of observations within the City Nature Challenge area boundaries for each city during the event.

**Places**

- In the Places tab at the top of the page, search for your nearest metropolitan area from the City Nature Challenge, or just search for your town. Choose one of the places that has been created. If you don't have a Place for your town yet, you may want to make one later!
- See the different features of this view: species list, observations, projects, even Wikipedia articles
- For example, we will use "Greater Boston" place later when we learn how to filter and search

Image: Map of "Greater Boston," the Place created for the 2017 City Nature Challenge: Boston Area with boundaries highlighted in orange. The area includes terrestrial and freshwater ecosystems within the I-495 corridor, from New Hampshire state line to Cape Cod canal. The area also extends out to include Massachusetts' important marine habitats, from salt marshes to Boston Harbor to Stellwagen Bank National Marine Sanctuary.

**Explain**

In the next activity, students will be comparing the species observed in two different places. To do that, we need to learn how to search and filter. This is a really neat tool anyone can use to explore data! Students will **need access to desktop computers** for this exercise. If no computers available, demonstrate to students using projector.

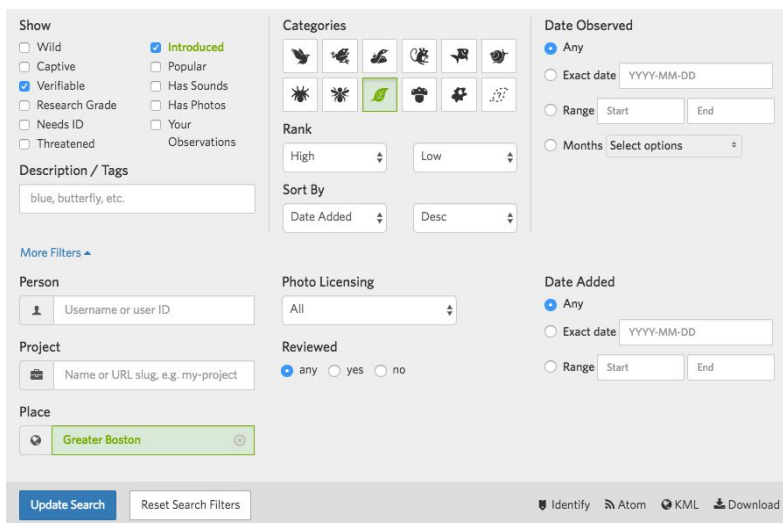

**First, demonstrate the basics: In the "Observations" tab:**

1. Demonstrate how to navigate observations. Show students how to toggle between the different views of observations: map, grid, and list.
2. Introduce students to the **search filter**.
  - a. Show students how to **search for a taxon and a place**. Review taxon group icons and checkboxes for threatened and introduced species.

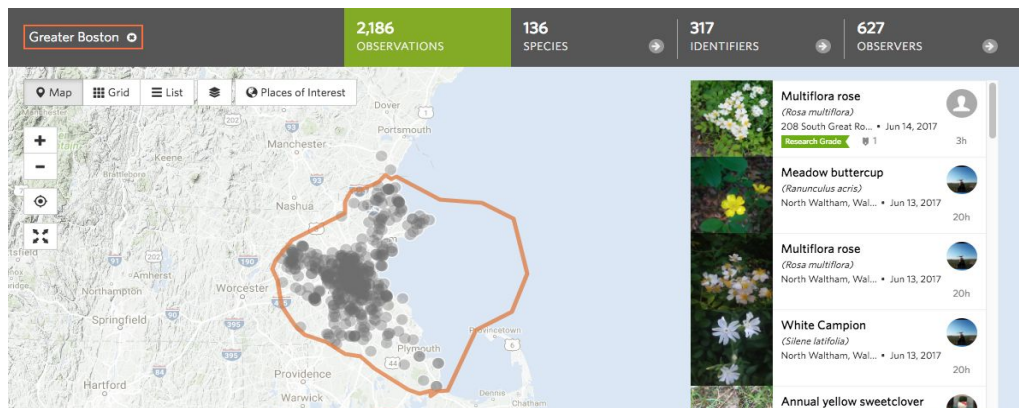

- Show students an example of filtering for a particular group, for example birds, then click “Update Search” to show all birds in the results.
- Show students some of the data that each of these observations hold. Click on one of the bird observations and point out the location, timestamp, identification, sometimes specific information (male/female, age, etc.).
- Show students how to zoom in and out on the map and click “redo search in map” to update results.

**Let’s use an example of a question you might use iNaturalist to address:** How many species of **invasive plants** have been observed in the **Greater Boston** area?

- On the Observations tab, click the “Filter” button next to the search bar. First, assure that the “verifiable” box in the upper left side is selected.
- Filter for Place:** Click the “More Filters” link on the bottom left corner to display additional fields. Type in “Greater Boston” in the Place field and select from the drop-down menu. This will limit all observations to within the Greater Boston area, the same area as the Boston City Nature Challenge.
- Filter for plants:** Click the plant icon and “Update Search” to display the number of observations and species for that taxon in Greater Boston region.
- Filter for invasive species:** Select the “Introduced” box in the upper left corner.

- Click “Update Search.” You should see something like this:

**Try another on your own:** What are the seasonal migration patterns of Blackpoll Warbler as observed by iNaturalist users?

1. Filter for Blackpoll Warbler observations during each month of the year. Look at the map and observe where the birds have been reported throughout the year. You will need to uncheck each month before you check the next month in the filter box.
2. Refer back to the [eBird Blackpoll Warbler Occurrence Map](#) from the Citizen Science presentation. Do iNaturalist observations display similar migration patterns to the looping migration from the eBird Blackpoll Warbler map? Why do you think this is?

## Elaborate

Visit the “[Getting Started](#)” page on [iNaturalist.org](#) to read and watch tutorials about [how to make and upload observations on smartphones](#) and [how to take good photos](#).

Make an observation and upload with mobile devices. First, demonstrate how to upload an observation. Then have students practice using leaves or insects collected from outside. If possible, bring students outside for 5-10 minutes to practice in the field.

Demonstrate to students how to “tag” an observation with a taxon - either the species name if they know it or a higher level if they do not. For example, if you photograph pine needles, students can “tag” the observation to Pines, or higher level like Conifers or Plants. Tagging an observation is important for others in the iNaturalist community to help find, identify, and verify observations to research grade quality.

## Evaluate

So far we have learned about biodiversity, citizen science, how to contribute to iNaturalist, and how our observation data will flow from iNaturalist to open science resources such as Global Biodiversity Information Facility ([GBIF](#)) and Encyclopedia of Life ([EOL](#)). Now it is time to get ready to go out and make some observations! From our previous activities, discuss the following:

- What taxon group are they most interested in studying?
- What groups do they think are underrepresented in the area?
- What groups do they think will be the easiest to find, and the hardest? The easiest to identify, the hardest?

Have students formulate a question they might like to investigate. Here are a few examples:

- What are the seasonal patterns of Gulf Fritillary butterflies as observed by iNaturalist users?
- What percentage of plants observed in your area are invasive or introduced?
- What are the differences in vertebrate species abundance observed in Seattle, WA vs. Miami, FL?

## Encyclopedia of Life (EOL) Extensions

Have students research a local species of interest using the [Encyclopedia of Life \(EOL\)](#), an open biodiversity resource. Students can design an [EOL Species Card](#) from a [blank template](#) for the organism.

- In [iNaturalist.org Places tab](#), search for your town, city, or state. Browse the species guide or search for a taxon group of interest (birds, reptiles, insects etc.).
- Choose a species and record the common name and scientific name.
- Go to [eol.org](#) and type the scientific name in the “Search” box in the center of the page. Click “Go.” This will go either directly to the taxon page for that species, or will provide a list of search results. Choose the taxon page that looks correct.
- The taxon page has several sections to gather information. The “details” tab has information about species physical description, habitats, life history, even molecular biology. Trait data can be found in the Data tab; photos, videos, and founds can be found in the Media tab, and so on.

*Ambystoma maculatum* add to a collection

- [iNaturalist Teacher’s Guide](#)

## Next Generation Science Standards

### Performance Expectations

- HS-LS2-2. Use mathematical representations to support and revise explanations based on evidence about factors affecting biodiversity and populations in ecosystems of different scales.
- HS-LS2-6. Evaluate the claims, evidence, and reasoning that the complex interactions in ecosystems maintain relatively consistent numbers and types of organisms in stable conditions, but changing conditions may result in a new ecosystem.
- HS-ESS3-3. Create a computational simulation to illustrate the relationships among management of natural resources, the sustainability of human populations, and biodiversity.

### Science and Engineering Practices

- Asking Questions and Defining Problems
- Analyzing and interpreting Data

### NGSS Nature Of Science Principles (Appendix H)

- Scientific Investigations Use a Variety of Methods
- Scientific Knowledge is Based on Empirical Evidence
- Scientific Knowledge is Open to Revision in Light of New Evidence
- Scientific Models, Laws, Mechanisms, and Theories Explain Natural Phenomena
- Science is a Way of Knowing
